E-Learning Modules
Module Import Instructions

To import the content to your LMS:

Blackboard

Use the file that includes 'ExportFile_' at the beginning of the file name in the folder. This is an export from a Blackboard 9 environment and should import without issue. All of the content items are included in the exported course file. Exporting the file will work into either a new or existing course shell. Note that the import may produce a trivial error related to voice authoring, which is a deprecated tool. This error does not relate to any course content. Please note that the course is in a module format and you should progress through the modules to ensure the course has imported correctly.

Moodle, Canvas, D2L,Sakai, Ilearn

Use the file that includes 'CommonCartridge' at the beginning of the file name in the folder. This is an export from a Blackboard environment using the 1.1 version of the Common Cartridge. Only the e-learning module was exported to minimize the Blackboard specific features in the common course cartridge. Depending on your individual LMS, there may be specific tools you can install to better process the import file.
