

In this concept map, I wanted to illustrate the fact that almost every stage of the design process can affect each other quite widely. Proper research can provide a stronger and more stable base with which to propose new ideas. In this, I also wanted to point out that new ideas are the key, and that a group shouldn't focus on finding perfection first, but rather, culminate their ideas to pick favorable traits from them and thus present a stronger solution. Finally, I wanted to ascertain that the solution must be checked with the customer to determine validity and effectiveness, and if shot down, one simply restarts the process in a multitude of different stages, whether it might mean more research is necessary, a different solution path should be taken, or have the design simply tweaked.
